

Tribological properties of carbon nanofillers added Si₃N₄ composites – A Review

Awais Qadir

<u>Supervisor</u>: Prof. Dr. Ján Dusza, Dr. Pinke Peter

PROBLEMS IN METALLIC BASED BEARINGS (GEAR BOX)

- Heavy and noisy
- Lack of chemical resistance (depending on the grade of steel)
- Require constant lubrication (high maintenance cost)
- Susceptible to corrosion in humid or wet environments
- May cause problems in medical applications due to its magnetic properties
- High friction coefficients (COF)
- High Coefficient of Thermal Expansion (CTE)
- High temperature oxidation

Semester Progress Report Jan - 2020, Obuda University

Why Si₃N₄ + Carbon nanofillers composites?

 Si_3N_4 is a promising structural ceramic material with high strength and high toughness that could replace metals in high temperature applications.

INFLUENCING FACTORS:

- Properties of nanofillers: Carbon nanofillers possess exceptional intrinsic mechanical, electrical and thermal properties.
- Interface between Si3N4 and carbon nanofillers: Improves the interfacial load transfer through functionalization.
- Dispersion of nanfillers in silicon nitride matrix: Carbon Nanostructures tend to agglomerate degrading the properties of nanocomposites.

Influence of CNTs on Wear rate and coefficient of friction

Influencing factors

The benefits of addition of nanofillers can be realized in tribological properties.

The uniform dispersion of nanofillers act as the lubrication and decrease the coefficient of friction and reduce the wear rate.

The main wear mechanism in the nanocomposite is abrasion accompanied with a pull-out of the carbon nanofibers which act in the interface as a lubricating agent.

Influential factors enhancing the tribological properties

uniform distribution of CNTs in the matrix

Load transfer efficiency,

Structure stability of CNTs during processing in the matrix,

Interfacial bonding between CNTs and matrix

Major challenges in integrating nanofillers in Si₃N₄

Uniform dispersion

Damaging of CNTs

Oxidation of CNTs

Clustering of CNTs

Densification inhibition

CNTs induce porosities in the composite

Poor interfacial boding between matrix grains and CNTs

Thesis Writing

Global energy consumption

According to International Energy Agency Report 2016

In total, ~23% (119 EJ) of the world's total energy consumption originates from tribological contacts. Of that 20% (103 EJ) is used to overcome friction and 3% (16 EJ) is used to remanufacture worn parts and spare equipment due to wear and wear-related failures.

Energy Consumption due to tribology

Semester Progress Report Jan - 2020 Obuda University

Impact on Global Economy

- 7 L/100 km = 15.4 Euros (Normal Car)
- Cost of fuel per Km $\approx 0.084 \in$

Up to 40 bearings are in a car.

Ceramic bearings are 35% lighter and smoother surface than metallic ones.

After the reduction of weight:

Saving of money = 0.004 Euros per km

Over 1 billion cars in the world:

0.075 x 1 Billion = 4 million Euros per Km
