Optimization of ball end milling tool path in case of free form milling

PhD Student: Abdul Whab Mgherony

Supervisor: Dr. Balázs Mikó

Main Topics

Freeform surfaces are defined as surfaces those have one or more nonplanar, nonquadratic surfaces that represented by parametric and/or tessellated models.

Ball end mills : Using Ball end mill has become widely in manufacturing specially in Highspeed machining process. The unique shape of the cutting edge (Helix-type, S-type, etc) gives this tool a vital role in machining sculpture surfaces or what it is called free form surfaces.

The aim of this research

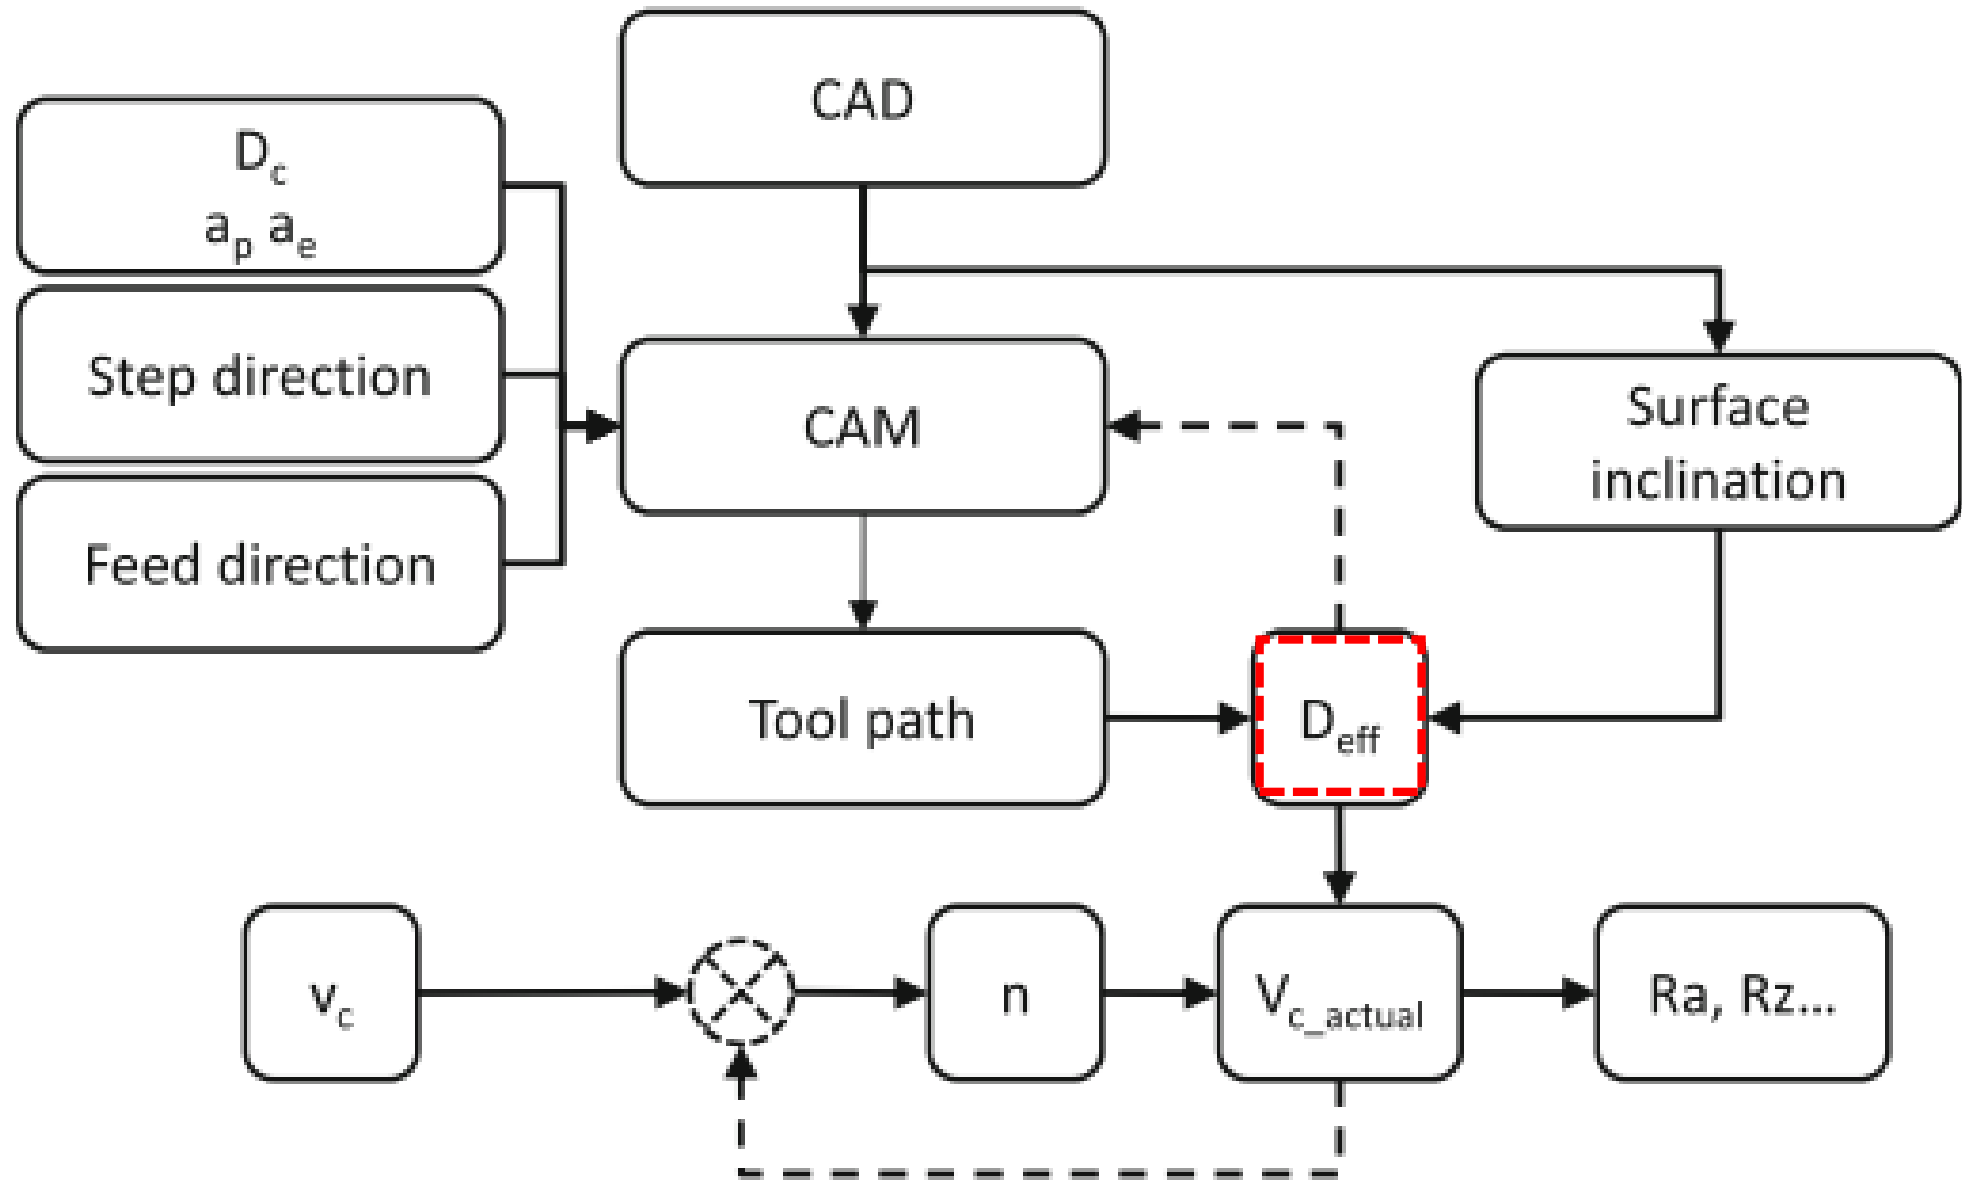

- The aim of this research is to find a new tool path planning strategy for freeform surfaces using ball end tool,
- which considers the changing of the working diameter and/or cutting speed.

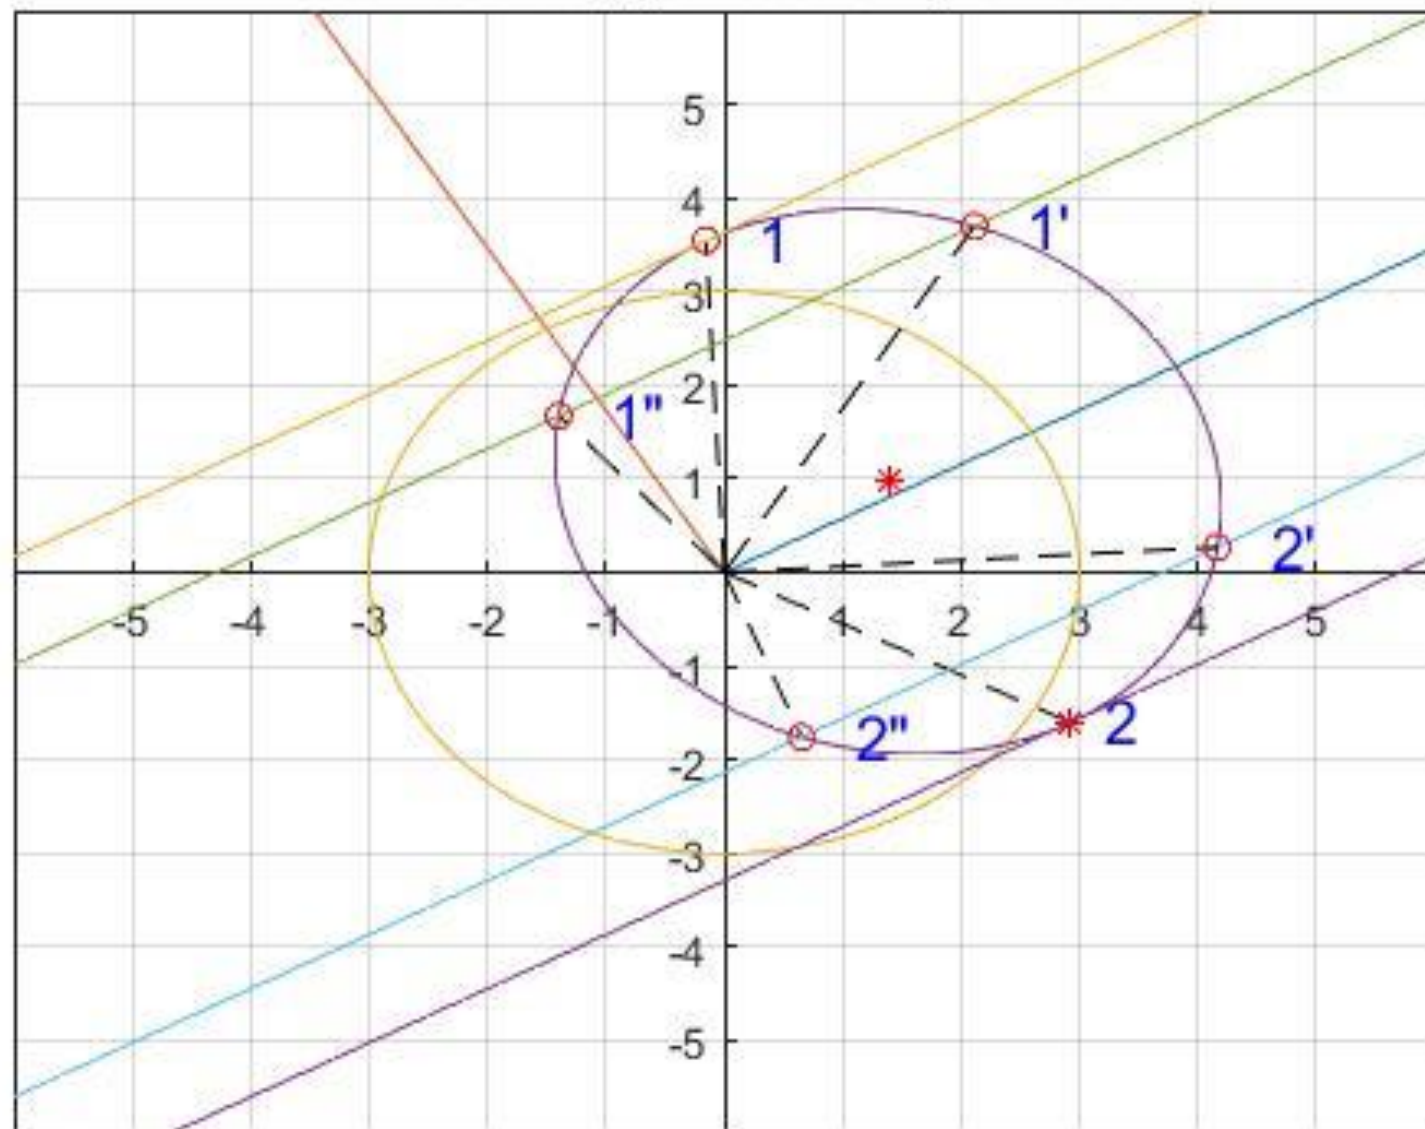

Results of the previous semester

- Implementation calculation of working diameter in Matlab

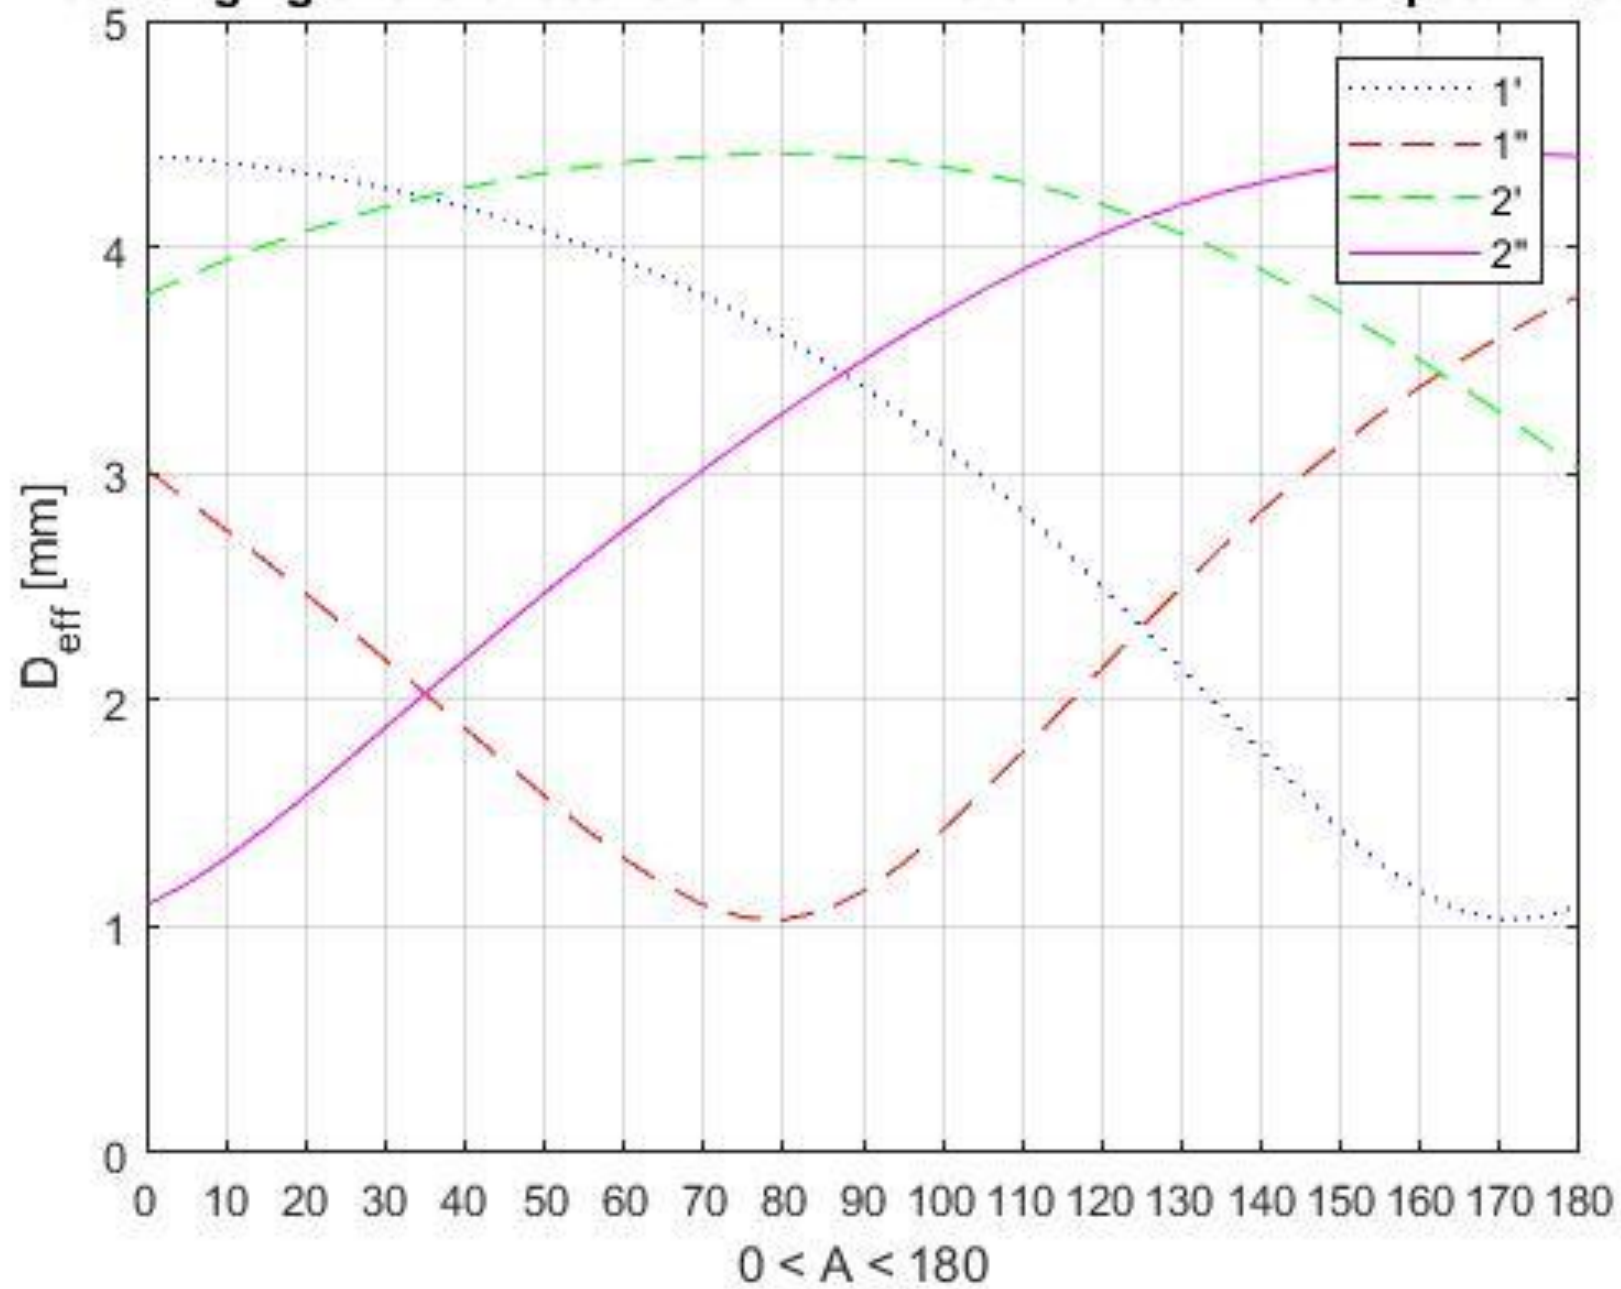

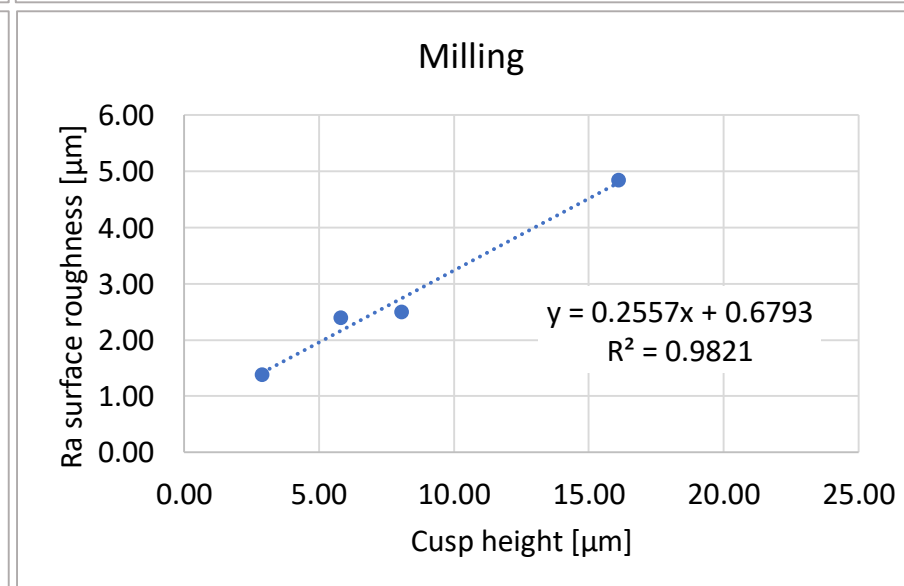

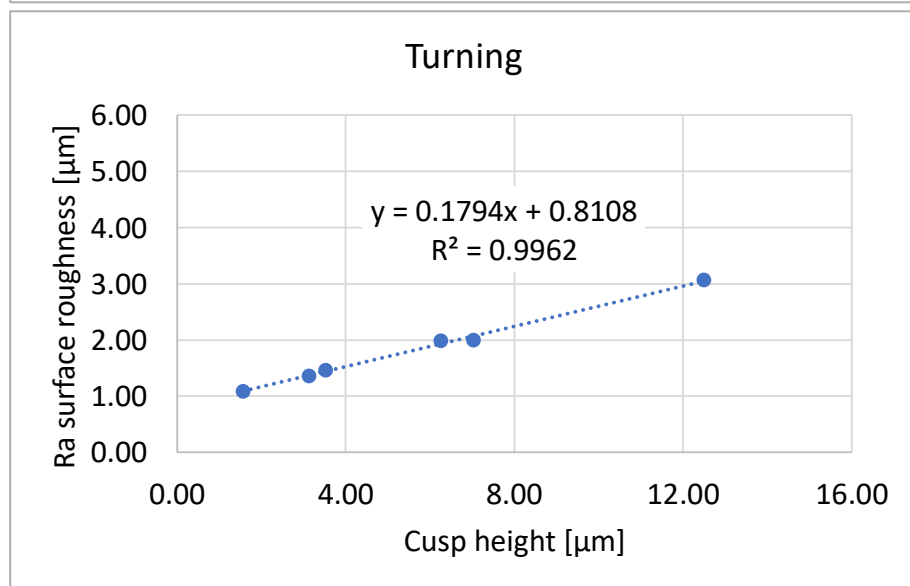

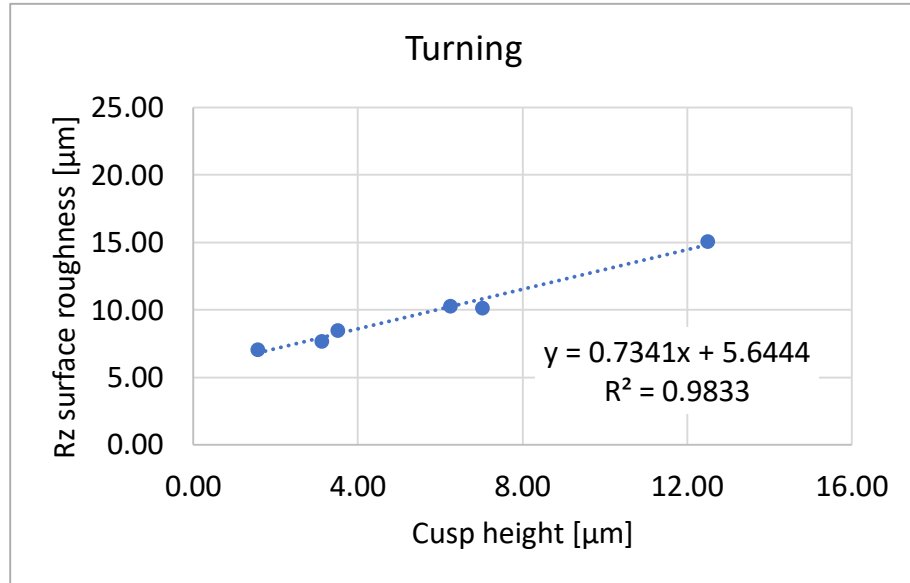

Four boundary points of chip removal

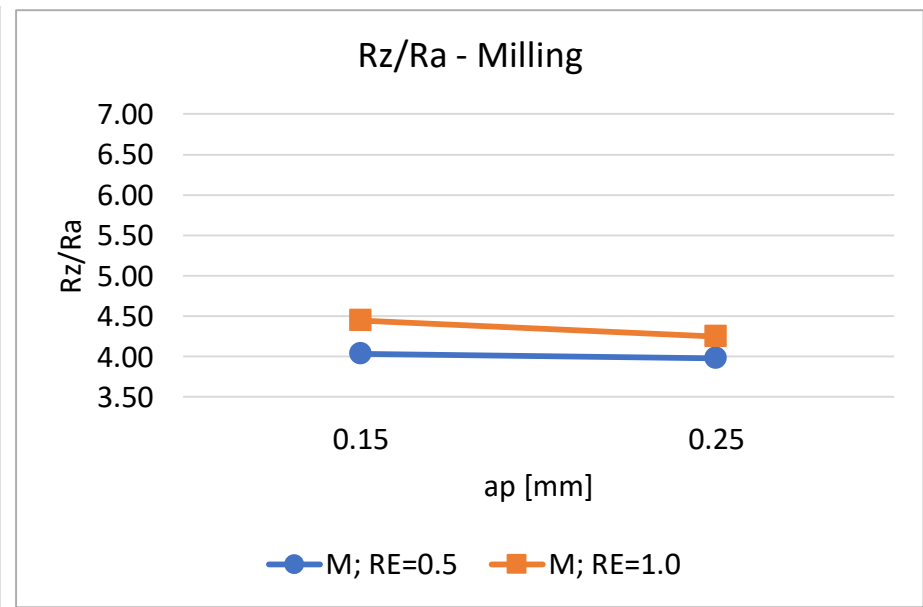

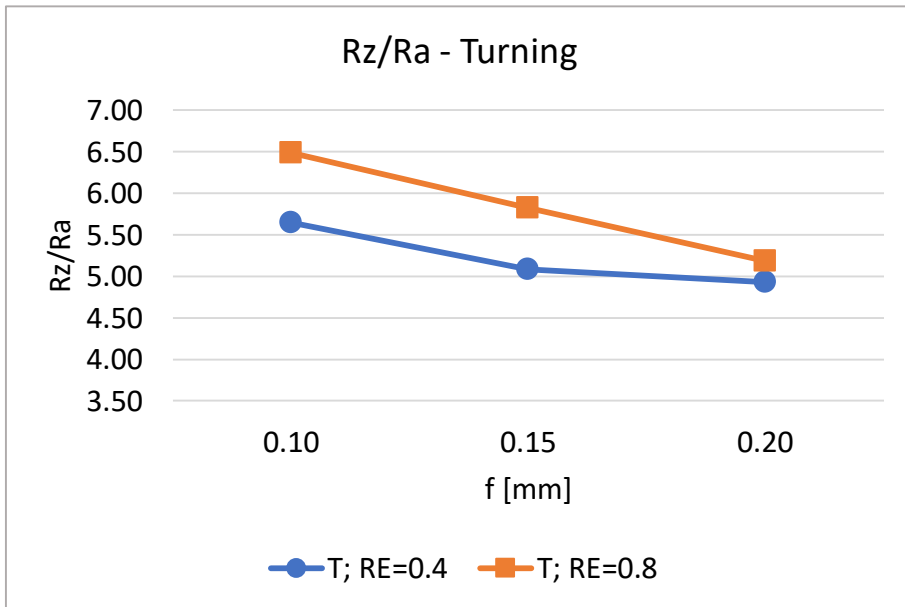

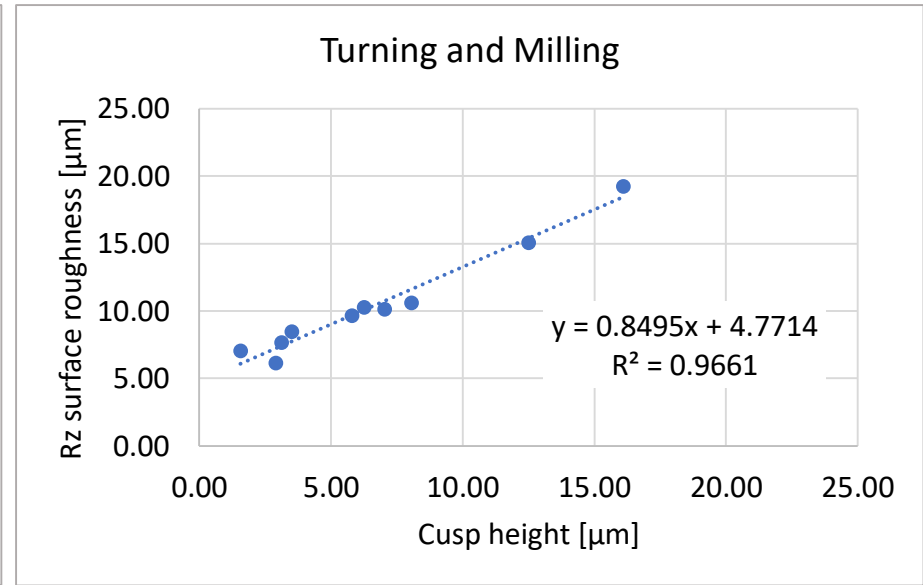

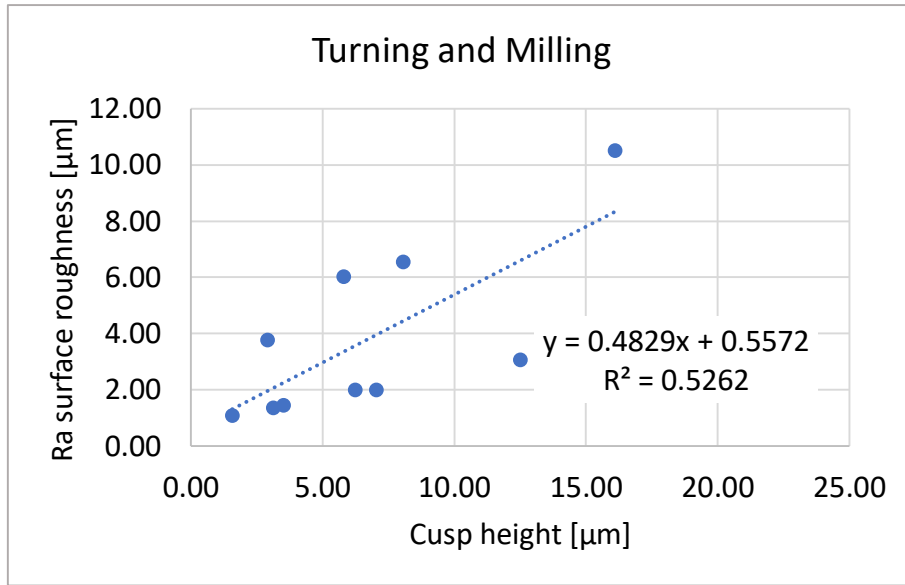

The changing of the effective diameter in the function of tool path direction

Milling vs Turning

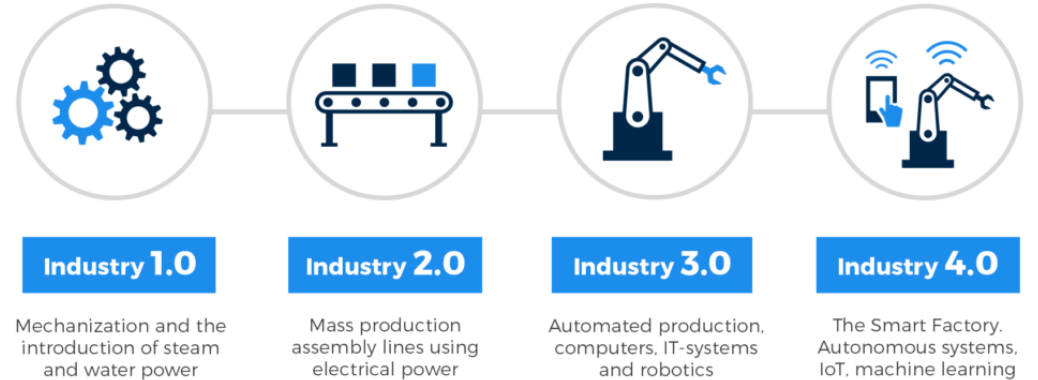

Courses
completed

- Industry 4.0
- Engineering education

The Four Industrial Revolutions

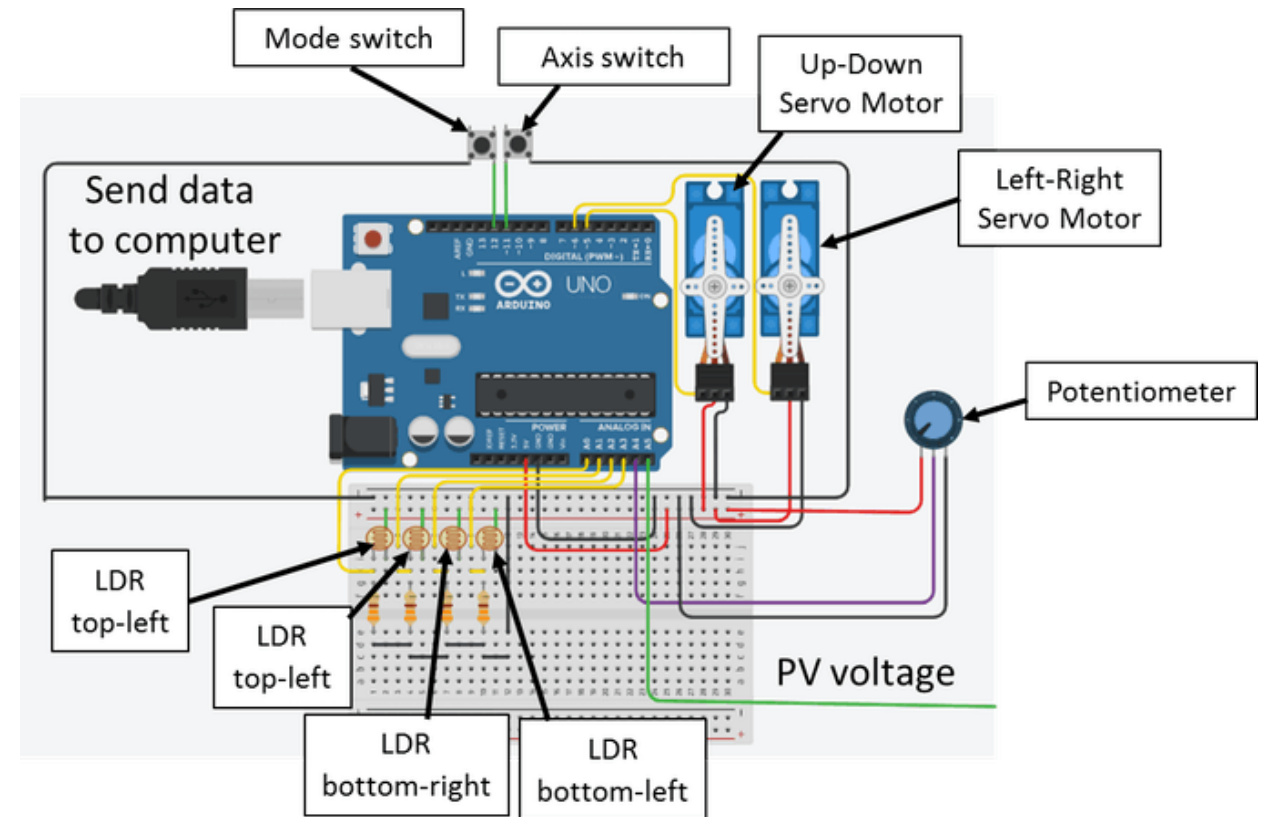

Publication

- Published:
 - Design of Experiment in Investigations Regarding Milling Machinery
- Ready to be published:
 - Comparison of surface roughness when turning and milling

Educational activity

- I am the supervisor for thesis work for a masters' student
 - Thesis title: Sun tracker solar system.

Future Work

- Analyse the tool-path planning strategies on the quality of the surface roughness in order to develop an optimal mathematical model. Besides, study the CAM systems and CAD interface.
